Geoscience & Remote Sensing

Small payloads at cosine

*Marco Esposito (Cosine), November 14, 2014,
12:40-13:30, CiTG 2.02*

Cosine's expertise comprises many techniques like altimetry, spectrometry, radiometry, multi spectral, stereo and high resolution imaging. cosine proves that also for space applications new measurement systems can be developed, built and qualified in short periods of time, this is achieved with a non-traditional approach, with a small, integrated team, focus on the important issues, transparency, and integration and miniaturization from the beginning. Few examples will be presented, including hardware used upon the International Space Station and for planetary science.
